

## Energy Storage Industry Corporate Responsibility Pledge

While recognizing and supporting the vision of at least 35 gigawatts of new energy storage by 2025, my organization also pledges to prioritize the well-being and safety of employees and end users when deploying, integrating and operating energy storage resources.

The actionable pathway defined by this commitment will enable the Energy Storage Association, its members and stakeholders to offer a considerable contribution to a clean energy future through the transformation of the grid.

With a more resilient, efficient, sustainable and affordable electricity grid uniquely enabled by energy storage, our nation stands to gain up to \$4 billion in cumulative operational grid savings and the potential for more than 167,000 new jobs in less than a decade.

Our commitment means that we will engage in a good-faith effort to optimize performance, minimize risk and serve as an exemplary corporate citizen in the implementation and operation of energy storage projects across the U.S.

Beginning this year, we will contribute experts in the field to a taskforce that will work to establish best practices in the following areas: potential operational hazards, end-of-life and recycling, and responsible supply chain practices.

By executing this pledge on behalf of my organization, effective on April 18, 2019, our company commits to considering all of the foregoing in the context of our U.S. business practices.
